RAW DATA FORMAT

Valid for daq version 4.7

Changes since version 4.6
* Added the unix time stamp in SOR and EOR headers.

Records in the data stream:

SOR	Start of run record.
EVENT	Event record.
RCU	Each event record consists of RCU data, each RCU has a header.
DATA	Event data of ALTRO format for each RCU.
EOR	End Of Run record.
BOF	If local data logging. If the file size exceeds a maximum size then the file is closed and a new file is opened and the first record in the new file is a Beginning Of File record.
EOF	If local logging. If the file size exceeds a maximum size then the file is closed and a new file is opened. The last record in the closed file is End Of File record.
POR	Pause run record
COR	Continue run record

If the data logging is done locally, then the filename is: readout-<runnb>_<filenb>.dat, where runnb is the run number, and <filenb> is a file counter, incremented with one for each file opened within the current run, and starting from 0 for the first file.

RCU data format over the DDL

The RCU data formatter converts the blocs of 4x40 bit altro words into blocks of 5 32 bit words. One such block will from now on be called a DDL block. In general the number of 40 bit altro words of a RCU payload is not divisible by 4, therefore the last DDL data block might have either 2,3 or 4 32 bit words. It is necessary to find the position of the last altro word since the RCU payload is a back linked list of altro data. The position of the last 40 bit altro word can be found by taking the size of the payload modulus 5. more specific (sizeof(ddlbuffer)/4 − header size − Ntrailerwords)mod5. The mod 5 value of the DDL buffer determines unambiguous the position of the last altro word and thereby the total number of altro word. In addition the RCU trailer contains the count of 40 bit altro words that can e used as a consistency check. Given the payload size mod 5 value the position of the last altro word can be determined as given below.

• **Segmentation 0:** The number of 40 bit altro words is divisible by 4, the last DDL block is filled according to the table below. Position of last altro word when the a DDL block is exactly filled i.e the number of altro words is divisible by 4. This corresponds to the case when N40bitwords mod 4 =0, or alternatively N32altroPayloadsize mod 5 = 0

N32 modulus 5 = 0

ALTRO WORD1 [31..0]		
ALTRO WORD2 [23..0]		ALTRO WORD1 [39..32]
ALTRO WORD3 [15..0]	ALTRO WORD2 [39..24]	
ALTRO WORD4 [7..0]	ALTRO WORD3 [39..16]	
ALTRO WORD4 [39..8]		

• **Segmentation 1;** The number of 40 bit altro words modulus 4 equals one, the DDL block is filled according to the table below. Position of the last altroword of the last DDL block in the case where the last DDL block is filled with just one 40 bit word. In this case the last DDL block consists of two 32 bit words. The least significant 24 bits of the last 32 bit word of the DDL block indicated by the gray area is not used and is padded with 0xAAAAAA. This corresponds to the case when N40bitwords mod 4 = 1, or alternatively N32altroPayloadsize

mod 5 = 2

N32 modulus 5 = 2

ALTRO WORD1 [31..0]	
AAAAAAA	ALTRO WORD1 [39..32]

• **Segmentation 2;** The number of 40 bit altro words modulus 4 equals two, the DDL block is filled according to the table below. Position of the last altro word of the last DDL block when the last DDL block is filled with two 40 bit words. In this case the the last DDL block consists of three 32 bit words. The least significant 16 bits of the last 32 bit word of the DDL block indicated by the gray area is not used and is padded with 0xAAAA. This corresponds to the case when N40bitwords mod 4 = 2, or alternatively N32altroPayloadsize mod 5 = 3

N32 modulus 5 = 3

ALTRO WORD1 [31..0]	
ALTRO WORD2 [23..0]	ALTRO WORD1 [39..32]
AAAA	ALTRO WORD2 [39..24]

• Segmentation 3; The number of 40 bit altro words modulus 4 equals three, the DDL block is filled according to the table below. Position of the last altro word of the last DDL block when the last DDL block is filled with three 40 bit words. In this case the the last DDL block consists of four 32 bit words. The least significant 8 bits of the last 32 bit word of the DDL block indicated by the gray area is not used and is padded with 0xAA. This corresponds to the case when N40bitwords mod 4 = 3, or alternatively N32altroPayloadsize mod 5 = 4

N32 modulus 5 = 4

ALTRO WORD1 [31..0]	
ALTRO WORD2 [23..0]	ALTRO WORD1 [39..32]
ALTRO WORD3 [15..0]	ALTRO WORD2 [39..24]
AA	ALTRO WORD3 [39..16]

NOTE: this format has not been used in any testbeam

Data format = 0: Reversed data format

For this version of the RCU firmware is the data reversed, i.e for each channel is ALTRO trailer with address and length the first word sent from the RCU.

ALTRO HW 40 bit word DATA example for one channel:

40 30 20 10

2AAA/2AEE (14 -bits)	# 10 bit words (10 bits)	A (4 bits)	12-bit hardware address

2AA	007 (length)	T92 (time stamp)	S92 (sample)
S91	S90	S89	S88

....

005 (length)	T12 (time stamp)	S12	S11 (sample)
S10	007 (length)	T06 (time stamp)	S06
S05	S04	S03	S02

If ALTRO trailer is corrupted for "Block Length mismatch while comparing against number of data strobes" OR "addressed channel mismatch as compared to the address in ALTRO trailer then this word is corrected. Corrected trailer word will contain the counted number of (data strobes * 4) = # of 10 bit words received and the addressed channel from RCU. This toghether with ERR_REG2 and ERR_REG3 in the RCU trailer (see below) can be used to detect faulty events.

The data is stored in 32 bit words as

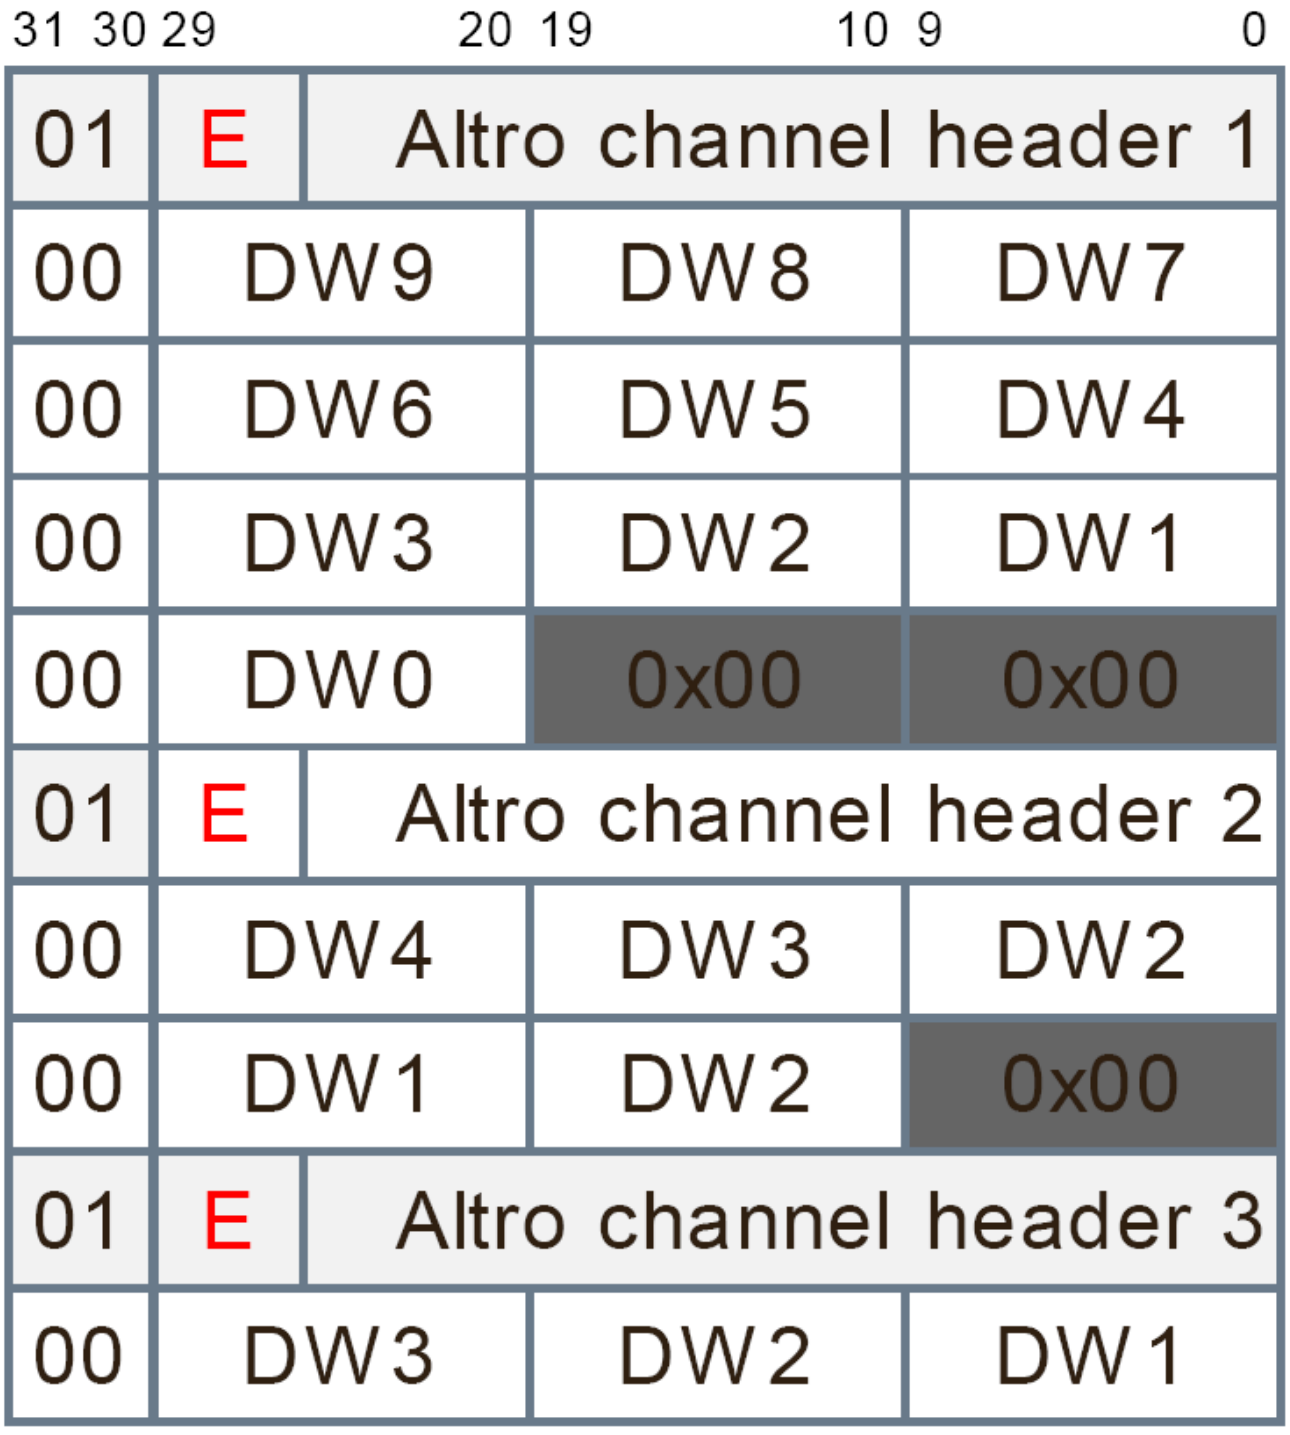
ALTRO WORD1 [31..0]			
ALTRO WORD2 [23..0]			ALTRO WORD1 [39..32]
ALTRO WORD3 [15..0]		ALTRO WORD2 [39..24]	
WORD4 [7:0]	ALTRO WORD3 [39:16]		
	etc etc		

This format was used in beam tests: 200903 and 200904.Due to a bug in RCU firmware was there events corrupted. This corruption was cured by new RCU firmware, resulting in a change of data format, version = 1

Code [31:26]	Name	Description [25:0]
0x00	PAYLOAD LENGTH	The payload length is expressed {No. of 40 bit words for DM} {No. of 32 bit words for RM}
0x01	ERR_REG1	Trailer[25:13] ≡ FECERRA[19 :7]; Trailer[12:0] ≡ FECERRB[19 :7]; FECERR[19] : *transfer* not released FECERR[18]: ALTRO *error* signal asserted while data being transferred; FECERR[17]:*transfer* not asserted; FECERR[16]: ALTRO *error asserted* before *transfer*; FECERR[15]: Write FSM error when started by RDO FSM; FECERR[14]: *ackn* not released by ALTRO; FECERR[13]: ALTRO *error* asserted while waiting for *ackn* to be released; FECERR[12]: ALTRO does not assert *ackn*; FECERR[11]: ALTRO *error* asserted while waiting for *ackn*; FECERR[10]: ALTRO asserts *ackn* before assertion of *cstb*; FECERR[09]: ALTRO *error* asserted while waiting for *ackn* in state “chkack”; FECERR[08]: ALTRO error asserted in state “assertbus” FECERR[07]: ALTRO error asserted in the execution of a broadcast command
0x02	ERR_REG2	ERR_REG2[8] : Block Length mismatch ERR_REG2[7]: Channel Address mismatch; ERR_REG2[6]: RDYRX error; ERR_REG2[5]: SCANEVLEN error; ERR_REG2[4:0]:EVLENRDO error;
0x03	ERR_REG3	ERR_REG3 [11:0] ≡ Number of mismatches in the channels address detected by the data assembler during the readout ERR_REG3[24:12] = Number of mismatches in the channel data block length detected by the data assembler during the readout.
0x04	ERR_REG4	NOT USED “00000000000….0000000000000”
0x05	FEC_RO_A	It defines the bit map of the “active” FECs of Branch A.
0x6	FEC_RO_B	It defines the bit map of the “active” FECs of Branch B.
0x7	RDO_CFG1	Copy of the RCU Register ALTROCFG1. For the definition of this parameter, see also ALTRO manual pags. 36,37. First Baseline Correction Mode ≡ RDO_CFG1[3:0] Polarity. When set, the ADC data is inverted (1’s C) [4] Nr. Of pre-samples excluded from 2nd baseline corr. ≡ RDO_CFG1 [6:5] Nr. Of post-samples excluded from 2nd baseline corr. ≡ RDO_CFG1 [10:7] Enable second baseline correction ≡ RDO_CFG1 [11] Glitch filter configuration for zero suppression ≡ RDO_CFG1 [13:12] Nr. Of post-samples excluded from suppression ≡ RDO_CFG1[16:14] Nr. Of pre-samples excluded from suppression ≡ RDO_CFG1[18:17] Enable Zero Suppression ≡ RDO_CFG1 [19]
0x8	RDO_CFG2	Nr of ALTRO Buffers (copy of RCU register ALTROCFG2[4]) ≡ RDO_CFG2[24] Nr of pre-trigger samples (copy of RCU reg ALTROCFG2[[3:0]) ≡ RDO_CFG2[23:20] Nr. Samples / channel (copy of RCU reg ALTROIF[9:0]) ≡ RDO_CFG2[19:10] Sparse Readout ≡ RDO_CFG2[9] $T_{sampling}$ / T_{LHC} ≡ RDO_CFG2[8:5] ➔ 00 = 2 (20MHz), 01 = 4 (10MHz), 10 = 8 (5 MHz) Phase of L1 trigger wrt LHC bunch crossing ≡ RDO_CFG2 [4:0]. The phase is internally calculated in terms of bunch crossing cycles. For example if the Tsampling/TLHC is equal 01 (10MHz sampling rate), only the two least significant bits are meaningful and the phase can take values 0, 1, 2, 3.
0x9	RCU ID	[25:16] ≡ 0x2AA ; [15:7] ≡ RCU Address Add[8] = 0 for A-side, 1 for C-side Add[7:3] = sector number (0:17) Add[2:0] = readout partition number (0:5) [6:0] ≡ trailer length (nr. of 32-bit words)

RCU TRAILER DATA FORMAT version 0

Data format=1: Three datawords in a 32 bit word



Order of 10 bit words in 32 bit data packet

Altro channel header [11:0]: [Channel Address from Altro]
Altro channel header [25:16]: [Block Length Number of 10 bit words from Altro]
Altro channel header [29]: E : Channel Error Bit, it is set to “1” if there has been a mismatch for channel address or block length received from ALTRO trailer. RCU will add a corrected Altro channel header followed by the data received from corresponding channel.

Altro channel header [31:30]: Word ID = “01” to mark ALTRAO Header : “00” for payload
Altro channel header [15:12] – [28:26]: Reserved = “0000”
DW: 10 bit data word.
0x00: Padding

Note that any AA padding in the raw ALTRO format is removed in this format.

Event data is followed by RCU trailer. This trailer comprises of 9 words of 32 bits. Start and end of RCU trailer is marked by two most significant bits. Each trailer word consists of parameter code and its value. RCU trailer format is described as followed.

31 30 29 26 25 0

Word ID	Parameter		Value	
10	Pay Load Length	0000	Number of 32 bit words	
10	Error Register 1	0001	Error Registers for Branch A and B	
10	Error Register 2	0010	Read out Errors	
10	Error Register 3	0011	Number of Altro Trailer Errors	
10	Act FEC A	0100	Active Front End Cards for Branch A	
10	Act FEC B	0101	Active Front End Cards for Branch B	
10	RDO CONFIG 1	0110	Readout configuration Register1 of Altro	
10	RDO CONFIG 2	0111	Readout configuration Register2 of Altro	
11	RCU ID	1000	RCU FW version	RCU address

[31:30]: Word ID: two most significant bits are used to identify the start and end of RCU trailer. Word ID= “10” shows that the word belong to RCU Trailer where as “11” shows that this is the last word of the RCU trailer.
[29:26]: Parameter: four bits field is used to mark different words in the RCU trailer
[25:0]: Value: These 26 bits are used to record the status of the parameters listed in the table for the event.

This data format was used the first time in the test beam at DESY of 200907. Note that the format version written in the run header was due to a mistake not correct for all runs.
